DNA

nan family.

ellular or multicellular, all organisms reproduce. y of their parents' DNA and therefore a copy of

Many organisms depend on behavior to regulate their internal environment. A chilly lizard may raise its internal temperature by basking in the sun on a hot rock. When it starts to overheat, it scurries for cool shade. Other organisms have control mechanisms that do not require any conscious activity. When a student is so engrossed in her textbook that she forgets to eat lunch, her liver releases stored sugar to keep the blood sugar level within normal limits. Hormones regulate sugar storage and release, but in other instances the nervous system is involved in maintaining homeostasis.

Living Things Respond

Living things find energy and/or nutrients by interacting with their surroundings. Even unicellular organisms can respond to their environment. The beating of microscopic hairs or the snapping of whip-like tails moves them toward

or away from light or chemicals. Multicellular organisms can manage more complex responses. A monarch butterfly can sense the approach of fall and begin its flight south, where resources are still abundant. A vulture can smell meat a mile away and soar toward dinner.

The ability to respond often results in movement: The leaves of a plant turn toward the sun, and animals dart toward safety. Appropriate responses help ensure survival of the organism and allow it to carry on its daily activities. Altogether, we call these activities the *behavior* of the organism.

Living Things Reproduce and Develop

Life comes only from life. Every type of living thing can **reproduce**, or make another organism like itself. Bacteria and other types of unicellular organisms simply split in two. In multicellular organisms, the reproductive process usually begins with the pairing of a sperm from one partner and an egg from the other partner. The union of sperm and egg, followed by many cell divisions, results in an immature individual, which grows and develops through various stages to become an adult.

An **embryo** develops into a whale or a yellow daffodil or a human being because of the specific set of genes inherited from its parents (Fig. 1.3). In all organisms, the **genes** are made of long DNA (deoxyribonucleic acid) molecules, but even so the genes are different between species and in comparisons are the basis of paternity testing. Although an individual's genetic makeup is unique, it consists of DNA from both parents. DNA profiles of a child and his or her biological parents are measured to provide the blueprint or instructions for the organization of the particular organism. All cells in a multicellular organism have the same set of genes, but only certain ones are turned on in each type of specialized cell.

Evolution Accounts for Diversity

What do the many breeds of dogs, the honeycreepers of Hawaii, and a child's antibiotic-resistant ear infection have in common? Evolution! Without **evolution**—change in a line of descent over time—we wouldn't see such a great variety of living things about us. But aside from its many benefits, evolution also sometimes causes problems for humans.

Some bacteria have evolved to the point that they are resistant to the antibiotics once successfully used to cure the diseases they cause. For example, antibiotics originally cured bacterial ear infections within a few days. Unseen, however, were the one or two bacteria with just the right mutation to resist a particular drug. All the descendants of these bacteria were also resistant, causing the antibiotic to be useless as a cure for this type of ear infection. The antibiotic is considered the *selective agent* because it allowed the resistant bacteria to flourish while killing their relatives.

What was the selective agent for the many breeds of dogs available as pets today? The answer, of course, is humans. We have selected which dogs...

PART III Evolution

14

Darwin and Evolution

OUTLINE

- 14.1 Darwin's Theory of Evolution 234
- 14.2 Evidence for Evolution 242

BEFORE YOU BEGIN

Before beginning this chapter, take a few moments to review the following discussions.

- Section 1.2** Why is evolution a core concept of biology?
- Section 9.1** What is an allele?
- Section 9.2** How does meiosis increase variation?

Use the Create content builder to select modules from the across the entire McGraw-Hill library and track the cost for students in real-time. Then 'publish' your custom material for purchase in either e-book or print form.
